

Pandemic.li

Privacy-focused social tracking
for Coronavirus

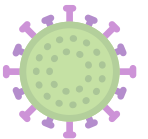

What is Pandemic.li?

Pandemic.li is a mobile app that allows you to keep a track of people you meet and places you visit. It also, optionally, keeps a track of your location in the background when you move. This data can be shared with healthcare professionals to help them track and find other potential cases.

How does it help?

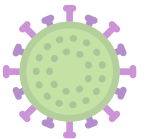

If you are infected, we anonymously notify everyone who has been in contact with you and anyone else who went to the same place as you to get tested and take the necessary precautions.

What about privacy?

All data is end-to-end encrypted and stored on the cloud. At no point is your identity ever revealed or shared with anyone. Even your location data is stored on the device until you choose to upload it.

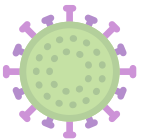

On sign up, we only collect the user's name and phone number.

Is the app ready? What do you need?

I'm ready to go live right now. There are a few backend features and location tracking that I'm working on which should be finished shortly but they don't impact the launch of the app.

I need a government or major health organisation to publish the app for me so Apple and Google will accept it. I will host and run it myself.

I'm Ali Zahid.

You can reach me at ali@pandemic.li
